

# The AI Bubble

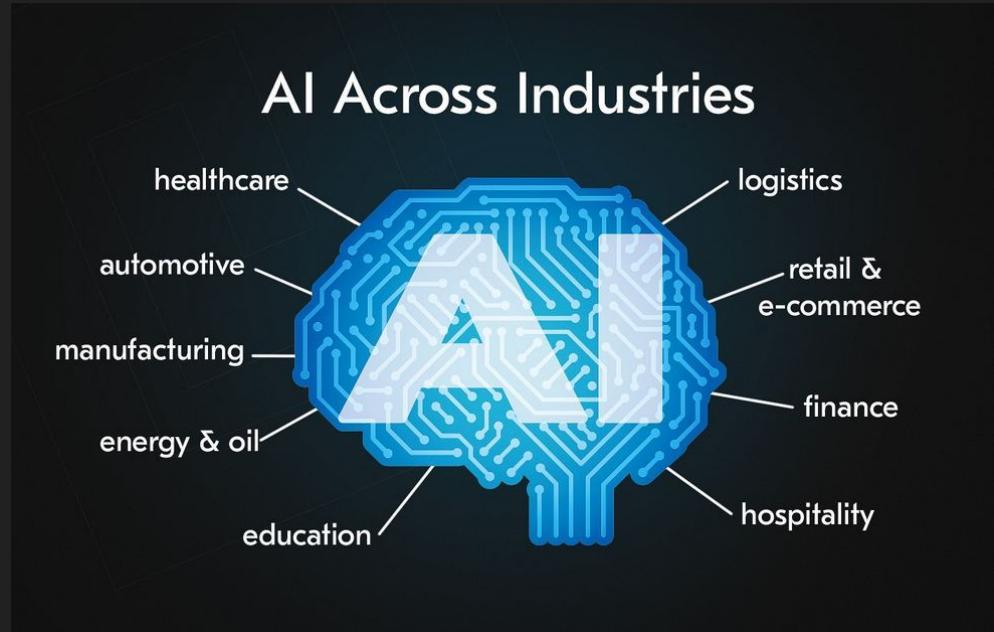

Whilst the bubble is a worry, AI application filtering is a more direct cause for the modern saturation of job markets. While its potential is high, it can miss out on the perfect candidates

**Everyone's Wrong About  
The AI Bubble**

# AI's Being Used In Companies

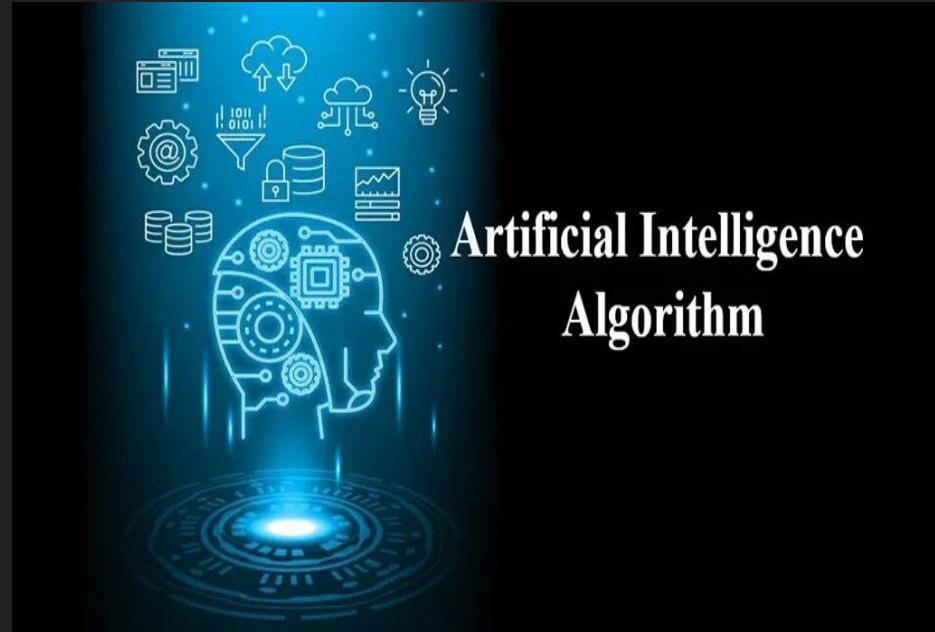

Companies over-use AI for human resources, where applicants are often filtered out because the algorithm finds their application unsatisfactory. When AI analyzes data, they lack personality, often not taking the human side of applicant into account. Since modern AI isn't a form of Artificial General Intelligence, they aren't able to think for themselves when reviewing applicants.

# Biases In Algorithms

This issue is compounded by biases in algorithms.

Despite having the potential to fix these biases, they are still prone to faults that a professional HR agent wouldn't make. This results into an unfair hiring process

# AI In The Future

There is already a report that 40% of employers expect to reduce their workforce, this causes a major displacement of skilled workers. The future is certainly uncertain as many predict, but what would happen to us, still learning in college, when we graduate in a few years?
